REHIS Prize for best Student and Dissertation in **MSc in Environmental Health 2012**

Title of dissertation: Stability of Measured and Modelled Spatial Contrasts of NO$_2$ Over Time in Scotland.

Having worked in the pharmaceutical industry for ten years returning to Higher Education provided the opportunity to consolidate and build on existing skills and knowledge. The MSc in Environmental Health encompassed subjects from a wide range of scientific disciplines making studying challenging, rewarding and enjoyable. In particular the examination of air pollution in Scotland, which was the subject of my dissertation, was of particular interest as air pollution is one of the few environmental factors influencing human health over which the individual has little or no control. I continue to be interested in this field of study and this now forms the basis of my PhD.
