The MSc in Hydrogeology is a good course for those that want a broad understanding of hydrogeological concepts at a deeper level than might be available through their undergraduate institution. It is a taught Master’s course so coursework can be intense but it also offers fun field components.

One of the best things about the MSc is its grounding in global water issues with courses that touch on water supply in rural Africa to transboundary laws affecting water supply in Asia. The course offers unique opportunities for dissertation research in many developing countries. My research consisted of a 6-week study in Malawi that was nothing short of life-changing and has provided the skills necessary to find work abroad.

Title of dissertation: “A field review of drilling practices and local geology in the Chapananga traditional authority of the Chikhwawa District, Malawi”
